

Software Product Lines and Requirements

Mathieu Acher

Maître de Conférences

mathieu.acher@irisa.fr

Material

<http://mathieuacher.com/teaching/IDE1718/>

Plan

- Challenges and Overview
 - Developing billions of software product is hard but now a common practice
- ~~Implementing Variability~~
 - ~~Revisit of existing techniques and curriculum~~
- Specificity of Product Line Engineering
 - Process, methods, requirements
- Feature Models
 - Defacto standard for modeling product lines and variability requirements
 - Syntax, semantics, automated reasoning

What you will learn

- The idea of software product lines and variability
 - You will be able to recognize this class of systems
 - Aware of the complexity, the specific development process, and existing requirement techniques
- Feature modeling
 - A widely used formalism for modeling product lines and configurable systems in a broad sense (incl. for requirements)

Variability and Software Product Lines

Perhaps, you ignore the names of something
omnipresent in numerous contexts

« A set of programs is considered to constitute a **family**, whenever it is worthwhile to study programs from the set by **first studying the common properties** of the set and then determining the **special properties** of the individual family members »

aka Variability

David L. Parnas — “On the design and development of program families” in Transactions on Software Engineering, SE-2(1):1–9, 1976

Variability

“the ability of a system to be efficiently extended, changed, customized or configured for use in a particular context”

Mikael Svahnberg, Jilles van Gorp, and Jan Bosch (2005)

Software-intensive systems

come in many variants

Description
A customizable battery case to hold batteries while traveling. Configurable for the number of batteries and type (as long as they're cylindrical). This is an updated version of the customizable battery carrier (thingiverse.com/thing:51376), re-designed to work without magnets as requested by GregFlak25.

Variability

Quizz Time

Give three examples of software product lines (also called configurable systems or variability-intensive systems)

Software is eating the world (any company will be a software company)

With software you can produce variants of software; in fact it is more general: you can produce variants of anything since software is everywhere

If you have the super-power to **“vary”**
Then you will rule the world

- Variants of code (e.g., Java ou C)
- Variants of user interfaces
- Variants of video sequences
- Variants of models (e.g., UML or SysML)
- Variants of « things » (3D models)

...

not, and, or, implies

Variability Models (feature models)

Variability: two definitions

- “the **ability** of a software system or artifact to be efficiently extended, changed, customized or configured for use in a particular context” (Svahnberg et al. 2005)
 - software/**customization** perspective
- “an assumption about how members of a family may **differ** from each other” (Weiss and Lai 1999)
 - more related to the notions of **domain** and **commonality**

Variability in time vs in space

- **Variability in Time (releases)**
 - the existence of different **versions** of an artifact that are valid at different times
- **Variability in Space (variants)**
 - the existence of an artifact in different **shapes** at the same time

Benefits

Improve product reliability

Improve usability

Improve consistency across products...

Benefits

Reduce production costs

Reduce certification costs

Shorten time-to-market

Hall of Fame

splc.net/fame.html

Printer Firmware

- Production cost reduced by 75%
- Development time reduced by 33%
- Reported defects reduced by 96%

A 3D maze background with white walls and a light gray floor, receding into the distance. The maze is composed of many interconnected paths and dead ends, creating a complex and confusing environment.

Variability = Complexity

(credits: Christian Kaestner's slide)

33 optional, independent features

a unique variant for every
person on this planet

320^{optional, independent} features

more variants than estimated
atoms in the universe

2000 features

10000 features

The specificity of
Software Product Line
Engineering

The development of a

family of software systems

differs from the development of

a **single** software system

Reuse

Commonality

Customization

Variability

Automation

Assembly Line and Mass Customization

Reuse and Mass Customization

A man with dark hair, wearing a dark sweater, sits at a dark desk with his hands pressed against his head, eyes closed in a state of frustration or stress. On the desk in front of him is a white sheet of paper with a pen resting on it. To the left of the paper is a glass of red wine, and to the right is a crumpled piece of white paper. Another crumpled piece of paper is on the desk to the left of the man. The background is a plain wall with a blue and white light gradient.

Starting from scratch?

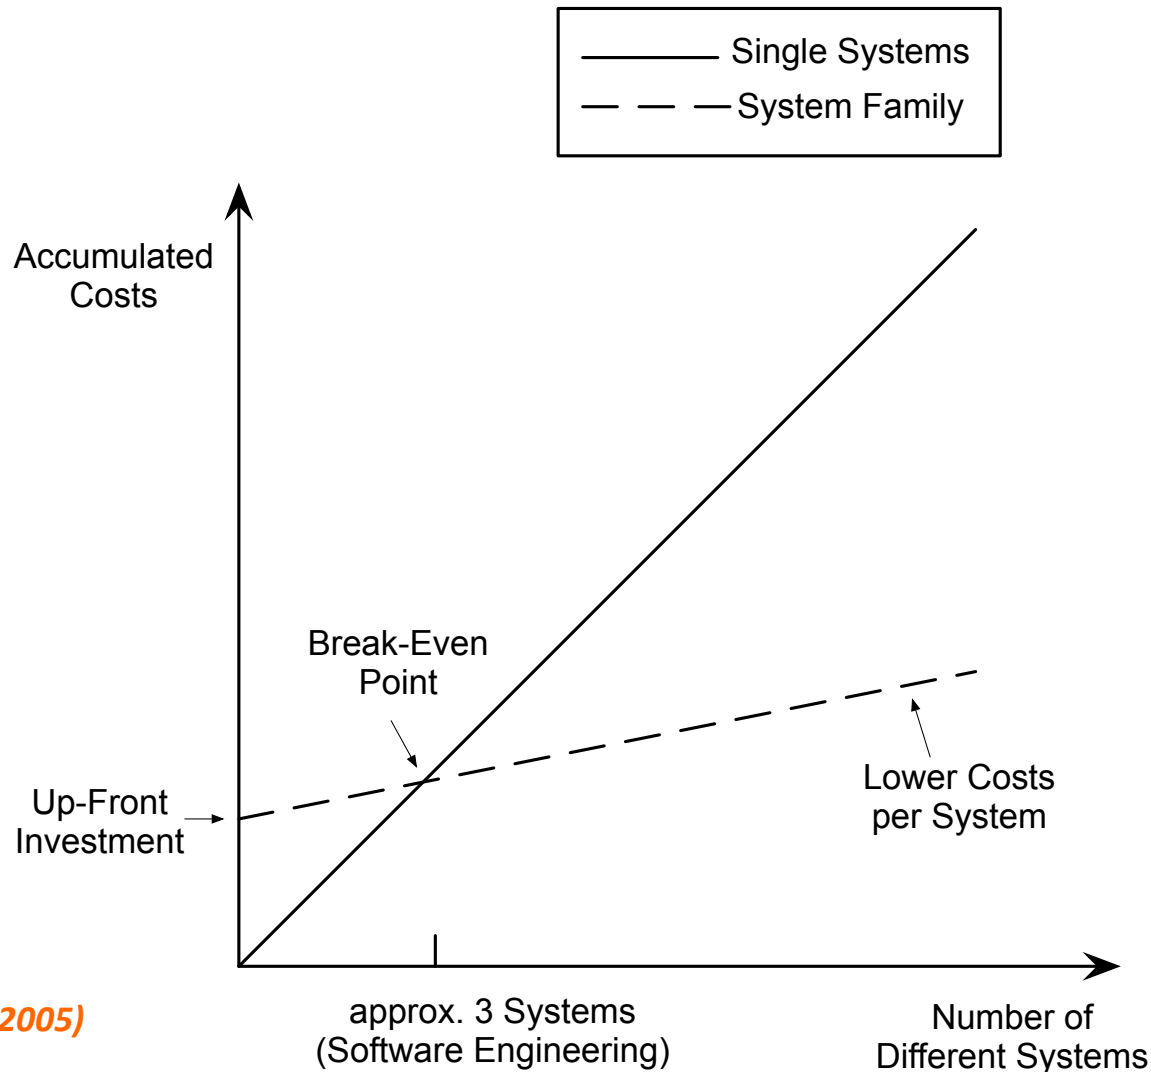

You cannot start from scratch

“a set of software- intensive systems that share a common, managed set of features satisfying the specific needs of a particular market segment or mission and that are developed from a common set of core assets in a prescribed way” [Clements et al., 2001]

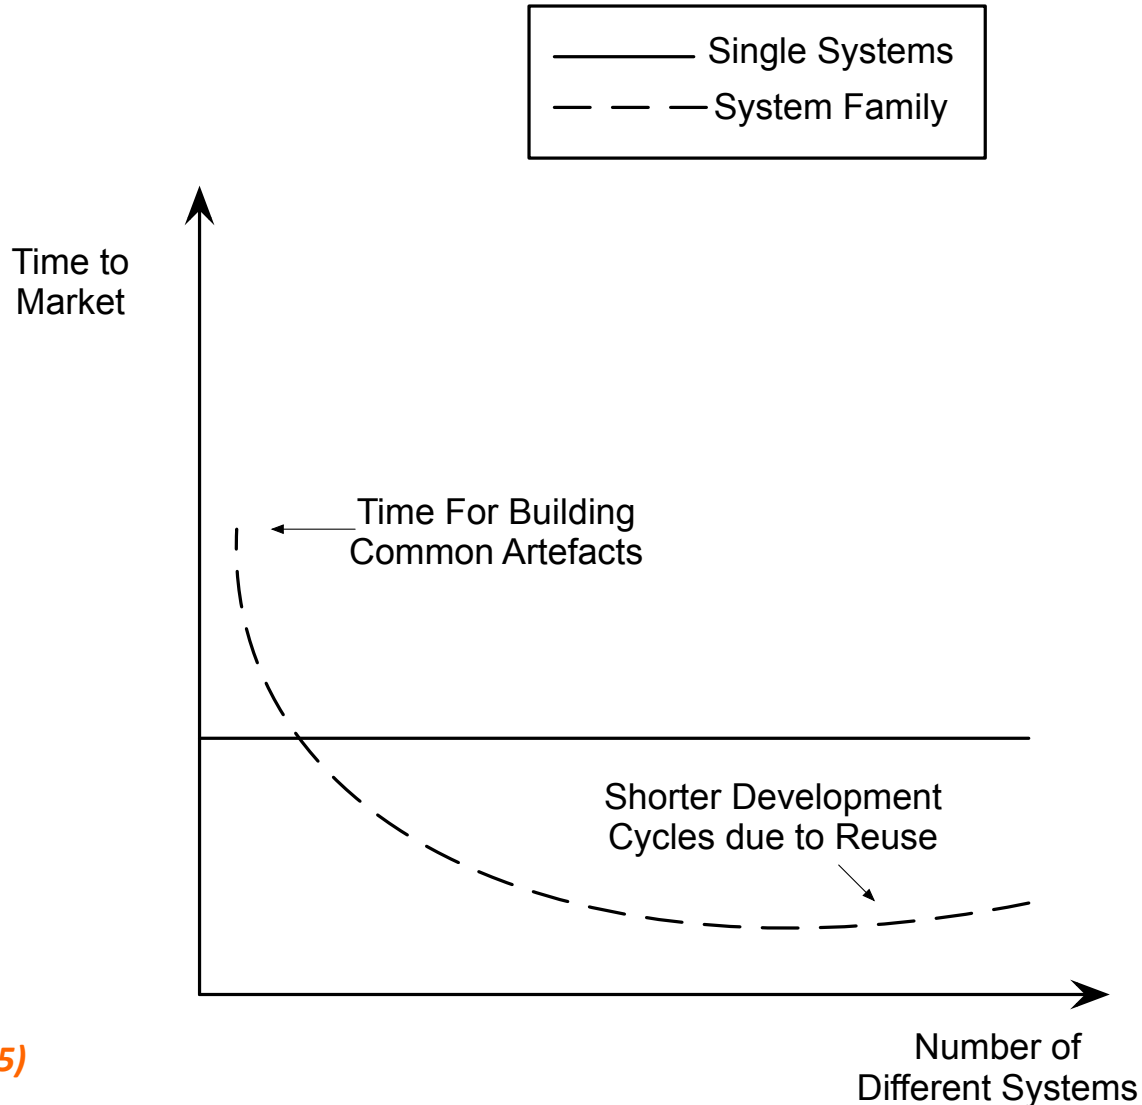

Software Product Lines

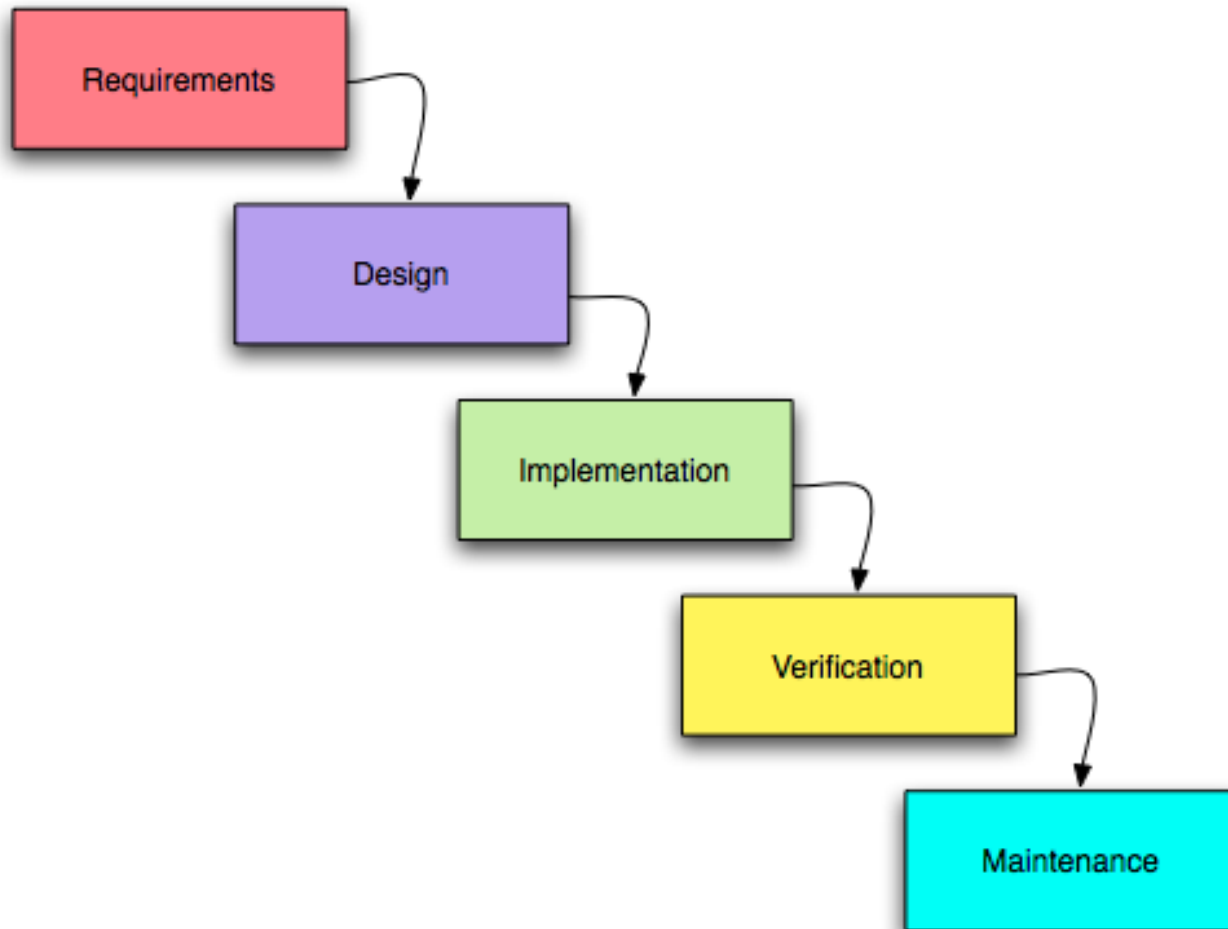

Promises of Software Product Line Engineering

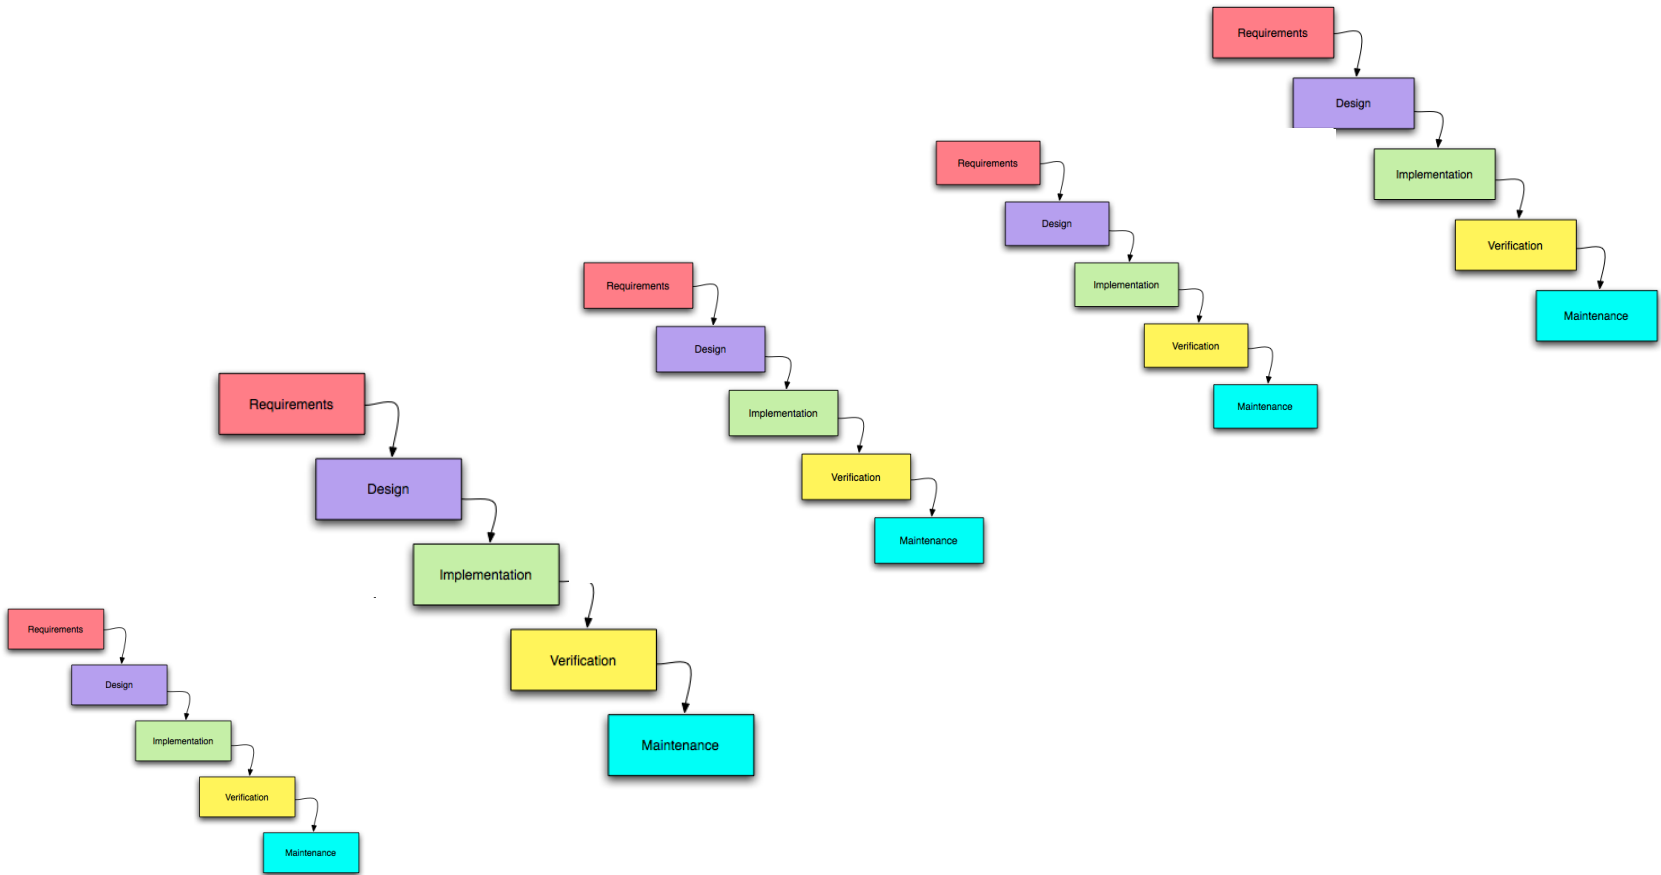

Promises of Software Product Line Engineering

Single Software Development

Software Product Line Development?

Time and Effort: not scalable!

We need an **engineering**
process specific to
software product lines

Observation: “Reuse-in-the-large works best in families of related systems, and thus is domain dependent.” [Glass, 2001]

Domain Engineering

[...] is the activity of collecting, organizing, and storing past experience in building systems [...] in a particular domain in the form of reusable assets [...], as well as providing an adequate means for reusing these assets (i.e., retrieval, qualification, dissemination, adaptation, assembly, and so on) when building new systems.

K. Czarnecki and U. Eisenecker

Domain Engineering

≈

Product Line Engineering

The conventional software engineering concentrates on satisfying the requirements for a **single** system

Domain Engineering concentrates on providing **reusable** solutions for **families** of systems.

Key idea: building a reusable platform during domain engineering

Specific requirements

product₂

product_n

product₁

70

Software Product Line Engineering

Factoring out **commonalities**

for **Reuse** [Krueger et al., 1992] [Jacobson et al., 1997]

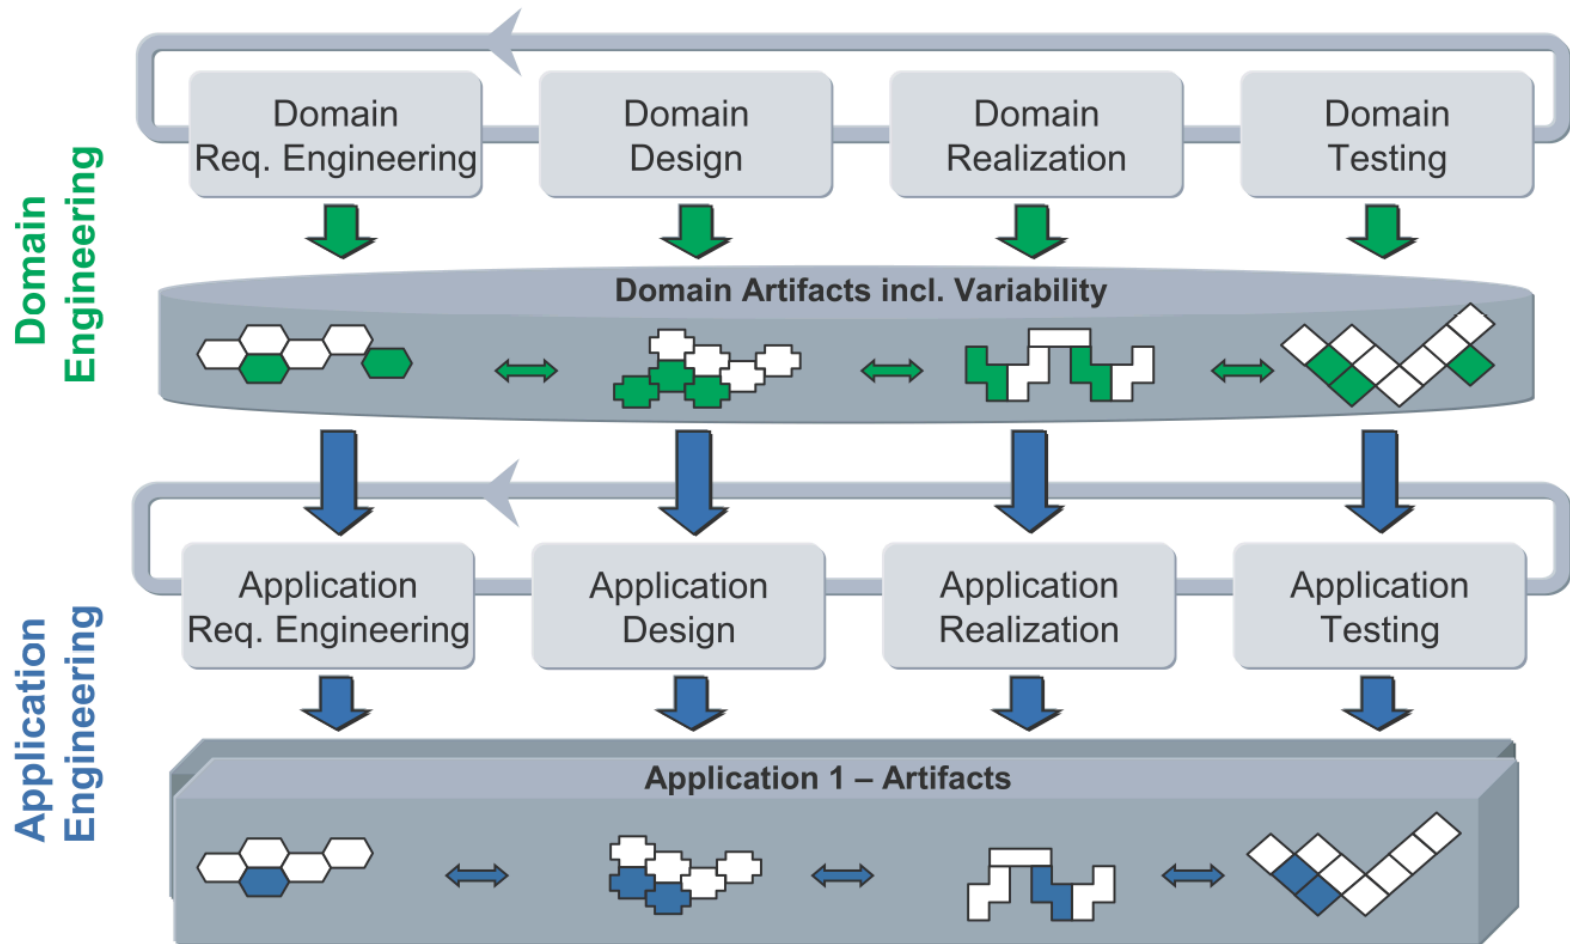

Managing **variabilities**

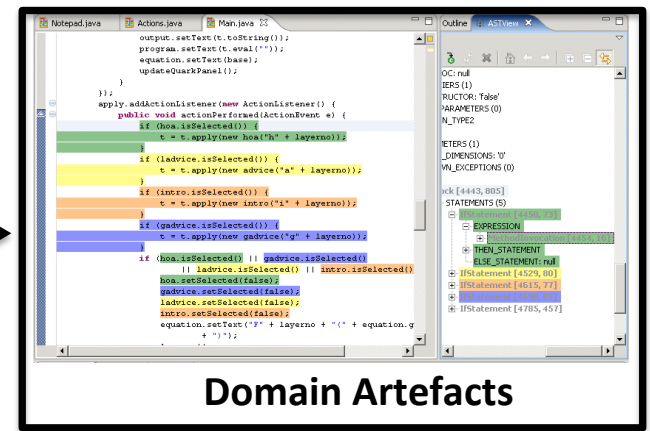

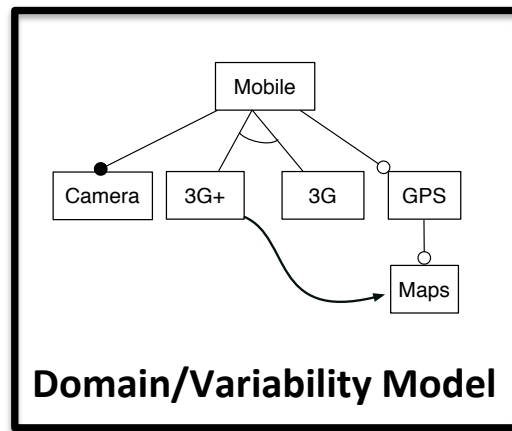

for Software **Mass Customization** [Bass et al., 1998] [Krueger et al., 2001], [Pohl et al., 2005]

Software Product-Line Engineering

Domain Engineering

Application Engineering

« the investments required to develop the reusable artifacts during domain engineering, are outweighed by the benefits of deriving the individual products during application engineering »

Jan Bosch et al. (2004)

“Reuse-in-the-large works best in families of related systems, and thus is domain dependent.” [Glass, 2001]

Domain engineering

Domain Analysis

(problem)

- elicitate requirements and scope the line
- variability modeling: determine commonalities and variabilities usually in terms of features

**Variability Model
(Feature Model)**

Domain Implementation

(solution)

Common assets

Variants

Reusable Assets

(e.g., models or source code)

Domain engineering (development for reuse)

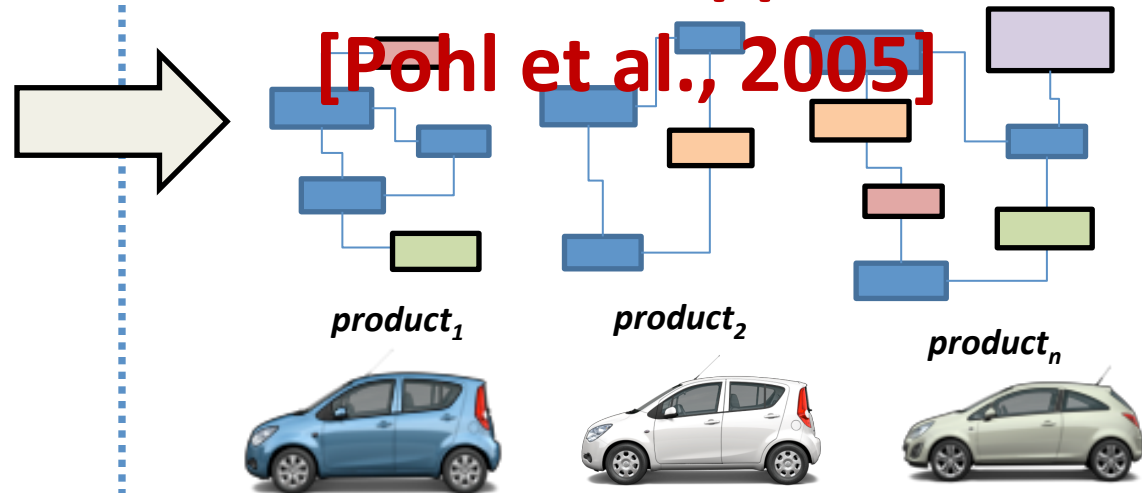

“central to the software product line paradigm is the modeling and management of variability, that is, the commonalities and differences in the applications”

Common Assets

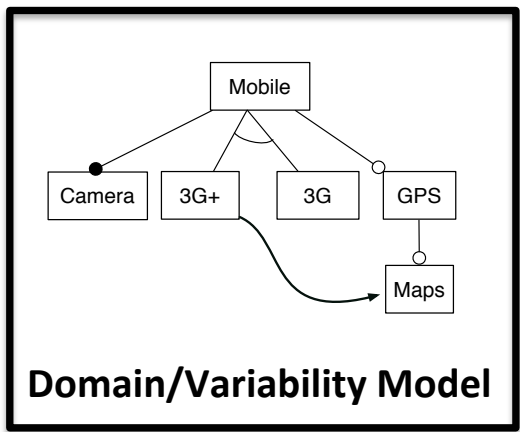

Reusable Assets
(e.g., models or source code)

[Pohl et al., 2005]

Application engineering (development with reuse)

Domain Engineering

Application Engineering

« the investments required to develop the reusable artifacts during domain engineering, are outweighed by the benefits of deriving the individual products during application engineering »

Jan Bosch et al. (2004)

Activities related to domain engineering and application engineering

Software Product-Line Engineering

Domain Analysis

- Collect relevant domain information
 - domain experts (interviews, workshops)
 - system handbooks, textbooks, prototyping, experiments,
 - already known requirements on future systems
 - Creative activity
- Domain Definition
 - examples of systems in a domain,
 - counterexamples (i.e. systems outside the domain),
 - generic rules of inclusion or exclusion (e.g. “Any system having the capability X belongs to the domain.”).
- Domain vocabulary
- Domain concepts
- and integrate it into a coherent *domain model*
 - more or less formal

*Czarnecki and
Eisenecker (2000)*

Domain Modeling (aka Metamodeling)

- Ontology, ER, UML, Ecore, Feature Model
- Analysis of similarity
 - Analyze similarities between entities, activities, events, relationships, structures, etc.
- Analysis of variations
 - Analyze variations between entities, activities, events, relationships, structures, etc.
- Clustering
- Abstraction
- Classification
- Generalization
- Vocabulary construction

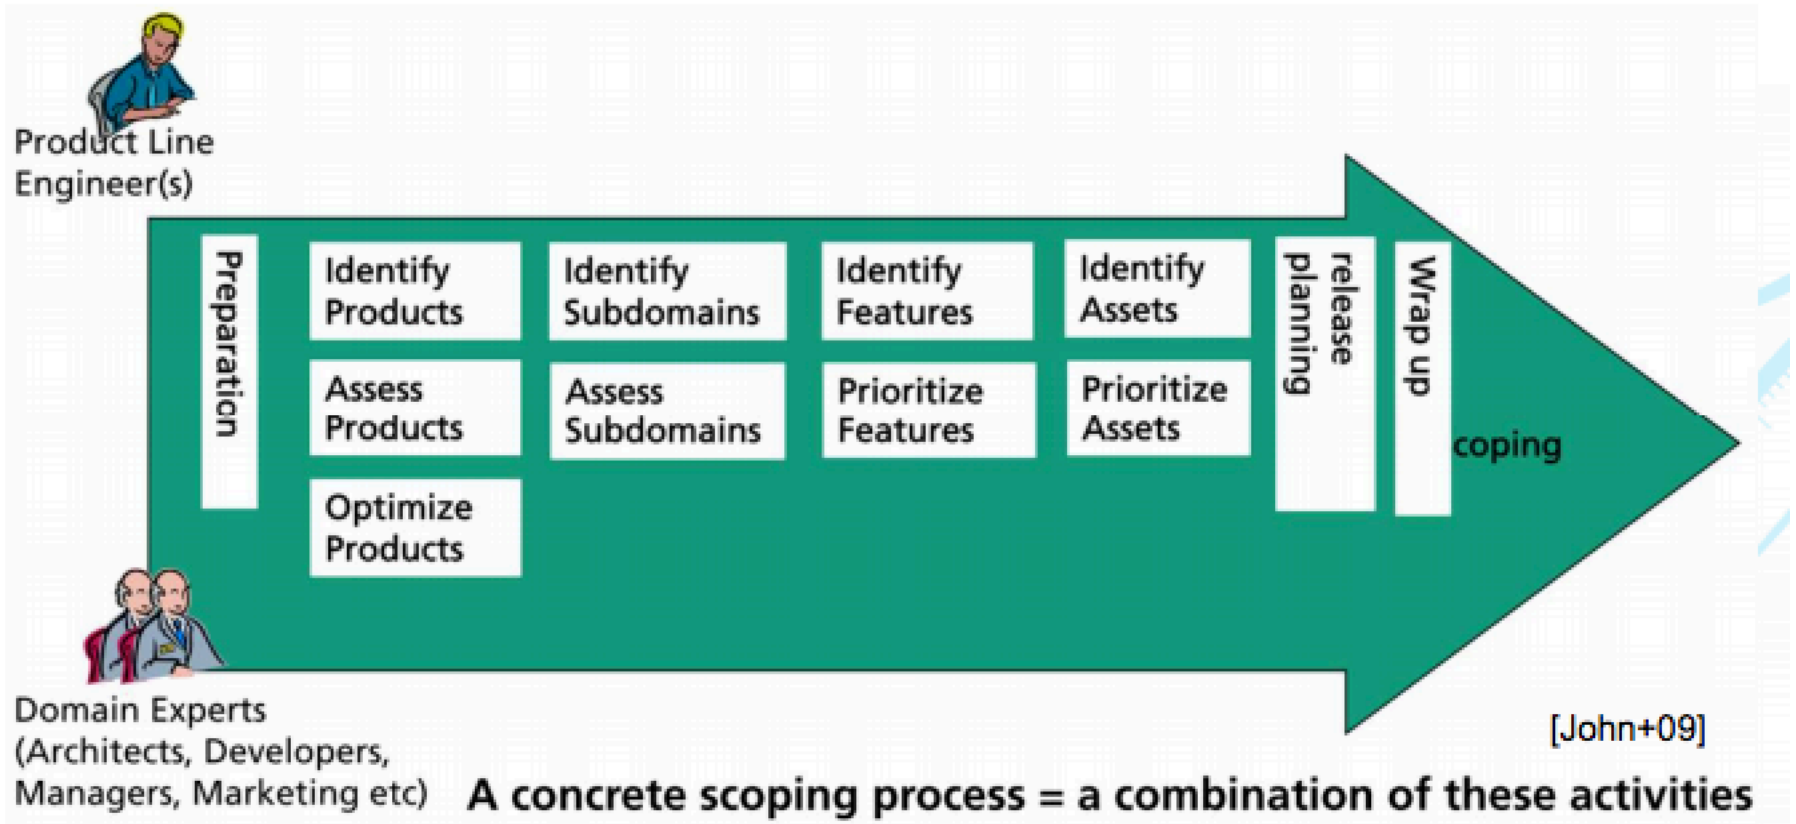

A vintage, rusted green truck is abandoned in a field of tall grass and brush. The truck is heavily weathered, with significant rust and missing parts, particularly the front end. The text "Unused flexibility" is overlaid in red on the truck's body.

Unused flexibility

Interactive Configuration

Software Product Line Engineering

- Family of systems, configurable systems: paramount but hard to develop, test, and maintain
- Specific development process: domain engineering and application engineering
- Domain engineering: elicitation of variability requirements, commonalities, features, scoping
- Modeling requirements: domain model, feature model, product comparison matrix
 - Based on the analysis of textual artefacts (e.g., product descriptions), source code, knowledge, workshop, etc.
 - Models can automate the derivation and testing of variants
